03 jump statements and common pitfalls

Detailed Theory, Exact C++ Rules, Memory Models & Exam Reference

03 — Jump Statements (`break`, `continue`, `return`)

- `break`: Immediately terminates the innermost enclosing loop or `switch` statement.
- `continue`: Skips the remaining statements of the current loop iteration and jumps to the loop's next iteration check (in a `for` loop, `continue` jumps to the `update` expression first!).
